News [Music/MP3 players]

Monday 9th January 2006

Swedes make music search out listener 3:38PM,

Monday 9th January 2006

A group of Swedish scientists is working on a technology that automatically delivers music to a phone or MP3 player without the user ever having to ask.

• FOCUS ON...

- o Broadband
- o Digital Cameras
- o Security
- o Processors
- o Operating Systems

The Push!Music technology will look for mobile devices in the vicinity and then read what music is stored on them and what has been listened to in the past. New music is then delivered via the wireless connection.

• USEFUL INFO

- o FAQ
- Based on what you have been listening to in the past and which files you already own, new music might spontaneously and autonomously "jump" from another device to yours (and vice versa),' they wrote, 'Later, when you listen to your songs, your Push!Music player also plays some newly obtained tunes that you had not heard before.'
